RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 32 pages. Original publisher: Asheville, NC : U. S. Dept. of Agriculture, Forest Service, Southern Research Station, 2000 OCLC Number: (OCoLC)137260533 Subject: Forest mapping. Excerpt: . . . relative magnitude of x y coordinates of the source and and U b o w n WDs between plotted positions may be target tree positions. detemined using the Pythagorean theorem with plot-center absolute coordinates. TreeMapper calculates Radial P1ot-O-n Mapping Method between any two points of interest in a Distance Calculator submenu. Horizontal distance between trees in the plot also may be calculated directly from polar coordinates using the Methodology and theory-The Plot-origin radial method is following equation derived From the law of cosines: usehl for mapping relatively small, roughly circular plots, such as variable-radius plots, in generally open stands where all trees of interest are in clear view from a central 9 2 --d r, r, r, cos (02 0,) r, i location. Survey data for this method are collected at a suitable fixed position near the center of the plot using the where Radial survey method. This central reference position, referred to as the reference origin or Plot-origin, is the d HD between any two plotted tree positions, r radial distance or magnitude, and position from which azimuth coordinates of all target tree 8 polar angle or direction (bearing), the vector components positions are measured. Horizontal vector data may be taken of polar coordinates acquired from a common origin. in either a clwkwise or a counterclockwise direction. Azimuth coordinates taken in sequence with the Radial However, this equation only may be used when all azimuth survey method correspond to tree combinations (O-l), (0 4, coordinates (from which all polar coordinates are...
